SAFETY BRAKES

For lifts, elevators, hoists and other machines

Type FPC
Automatic reset

Description

The FPC safety brake is a mechanical unit designed to prevent accidental falls in lifting gear motorized by transmission sprockets or rack and pinion devices.

The system only operates when the descent rate exceeds a predetermined value. The sensor elements act by the action of centrifugal force and interlock the follower pinion against the structure of the elevator. The locking occurs in a progressive way. The platform is immobilized after being braked.

By actuating the mechanism in the opposite direction to interlock, the brake returns to its original state. For the proper operation of the machine it is essential to analyze the causes that triggered the security system and solve the problem.

These safety brakes incorporate a microswitch which operates in the interlocking. This signal can cut the general current of the elevator, activate an alarm, etc.

Features

FPC safety brakes prevent accidental falls in all types of lifting devices (pinion-rack, drum-wire, etc.).

Compact and robust, they are particularly suitable for installation in wind tower elevators, cranes and other industrial applications.

The operation is completely mechanical. No force or external signal is required to work.

The system only operates when the descent rate exceeds a predetermined value. The braking starts immediately when the speed is surpassed, immobilizing the platform. Braking occurs progressively.

Automatic reset without manipulation backing to the point of origin

The system incorporates a protected inner microswitch which acts at locking. Thus, the signal used to cut the power, trigger an alarm, etc.

Blocking directions: clockwise, anticlockwise, and bidirectional.

Certified product according to EN 12158, EN12159, EN 1495, 95/16/CE and ATEX 94/9/CE directives.

The unit must be firmly attached to the platform structure so that the sprocket is perfectly centered and in engagement with the rack. After mounting the unit, connect the cables to the micro connector. Typically, this is in closed position.

The long experience of our company in security requires us to the realization of the product.

The FPC brake is delivered regulated according to the specific characteristics of the machine on which it will be mounted. As ever this should be mounted on a different machine, its traceability must be ensured.

The parachute is sealed for safety, preventing the further handling.

Electromagnetic, pneumatic brakes and clutches
Mechanical safety brakes · Centrifugal brakes
Flexible couplings · Torque limiters · Special units
SAFETY BRAKES
Type FPC

Examples of applications of FPC brakes to diverse systems (rack and pinion, drum-wire, balancing, etc.)
Also applies to overhead doors, counterweights, palletizers, strapping, squips, retractable baskets, baskets, shelves, etc.

Versions
Unidirectional · Bidirectional · Double shaft · Special models.
